Class test CO1-AT-3

Cloud Computing

K. Nandhakumar
192126022 3.

① Define Cloud Computing

Cloud computing is delivery of Computing Service such as Server, Storage, database network and Software through internet

Four Characteristics

* on-demand Self-service
* Board network access.
* Resource pooling
* Rapid elasticity

---

② Evolution of Cloud Computing

Cloud Computing develop through Several Stages:

=> Hard evolution.
=> maninframe Computing
=> Client Server Computing
=> Web Server computing
=> virtualization
=> modern Cloud Computing

③ Role of Server Virtualization

Server Virtualization divide one physical Server into multiple Virtual machine (VMS) using a Software layer. Called hypervisor

Role in Cloud Computing

⇒ Improve Server Virtualization
⇒ Reduce hardware Cost
⇒ Allow multiple user to share resource
⇒ provids flexibility and Scalablety
⇒ makes resourse allocation easy
⇒ support quick Creation and deletion of virtual machine

Virtualization vs	Cloud Computing
Virtual resource can work without internal	Service delivery model usually across through network
Ex:- Vm.	Ex- AWS EC2.

④ Role of data center in Cloud Service

A data Center is facility containing Servers, Storage System, networking Equipment and other infrasbructure.

Role:-

→ Computing
→ Storage
→ networking
→ security
→ Back up
→ Scalability
→ Availability

Data Centers are the physical foundation of Cloud Computing they provide the hardware and Infrastructure require to deliver Cloud Service

(5).

① Iaas - infrastructure as a Service:

Provide virtual Service, Storage and working through the Internal

Ex- Amazon EC2

② pass - platform asa Service

provide virtual Server Storage and networking through the Internal test deplay. application

Ex - Google App Engine.

③ Saas - Software. as a Servis

Provid ready to use Software through the internet user need not Install or maintain

Ex :-

Google work Space.
